

QLF[®] THE FORMULA FOR MAXIMUM CUSTOMER BENEFIT

The **Quick Lock Formula[®]** alliance has been formed by a group of manufacturers who have agreed upon a common standard for the QLF[®] Interconnect System. This system, which comprises QMA and QN coaxial connectors, is an emerging interface concept that is widely accepted for interconnection among global infrastructure telecommunication OEM's.

While displaying the same technical performance as threaded SMA or N types, these connectors feature a snap-on interface, 360° rotation after mating and denser packaging to improve the quality of radio frequency interconnections while saving time during the connection process.

Under the alliance there are four global QLF[®] suppliers: Radiall and Huber+Suhner who jointly developed the connector concept, and their licensee's Rosenberger GmbH and Amphenol RF who will become shortly the newest member.

As a quality commitment to its customers, the QLF alliance is performing a compliance test on an annual basis. Connectors of all parties are being cross-checked in order to verify the mechanical intermateability between each other as well as other crucial performance parameters.
